Midterm: Teaching Learning Activity 1
Name: Mark D. Guanzon
Course: BSIT - 4

Name of Client: Eduardo Jude Teves	Date: September 1, 2025
Common Problem: occurred in your computer	PC is not functioning properly and requires a reset
Identify the problem	The computer is experiencing performance issues or software glitches necessitating a full reset.
Establish a theory of probable cause	Possible causes include corrupted system files, malware, or accumulated software conflicts.
Test the theory to determine the cause	Check for error messages, run a basic diagnostic, or review recent software installations.
Establish a plan of action to resolve the problem	Perform a factory reset or system restore to return the PC to its original state.
Implement the solution	Back up important data, then follow the PC's reset instructions, via Settings, Update & Security, Recovery, Reset this PC.
Verify full system functionality and, if applicable, implement preventive measures	Ensure the PC boots correctly, reinstall necessary software, and set up regular backups.
Document findings, actions, and outcomes	Note the reset was successful, and the PC is now functioning normally.
	Client's Signature Eduardo Jude Teves

Resetting and Formatting

Nasser Hilla • Jul 30

5/5

Due Jul 30

What is the difference between Resetting and Formatting?

Your answer

Graded

reseting is reinstalling the local os only and when you reset you can just do it in a windows os while, formatting you have to save your files in a usb drive or back it up, before removing everything in short formatting means "corrupt everthting " and formatting is internal reset when the os is not working due to lag issue thats when the formatting comes in.

in summary

1. reset is local reinstall with in the windows
2. formating is internal reset and corrupt everything outside of the windows

Teaching Learning Activity: 2

Search and list down the following types of Operating System below:

TYPES OF OPERATING SYSTEM	DEFINITION	ADVANTAGES	DISADVANTAGES	EXAMPLES
Batch Operating Systems	An OS where similar jobs are grouped together and executed as a batch, without direct user interaction during processing.	Efficient for large jobs; reduces idle time; easy to manage repeated jobs.	No direct interaction; debugging is difficult; turnaround time can be high.	Payroll systems; older mainframe systems.
Multiprogramming Operating System	An OS that allows multiple programs to reside in memory at the same time, sharing the CPU, so that when one program waits for an I/O operation, another can run.	Increased CPU utilization; improved throughput; reduces response time for some tasks.	More complex to design and implement; requires careful memory management; potential for starvation of processes.	Unix, Linux, Windows early versions with limited multitasking.
Network Operating System	An OS that runs on a server and enables it to manage data, users, groups, security, applications, and other networking functions. It allows shared access to files, printers, security, applications, and other networking	Centralized servers are highly stable; security is managed by the server; easy to upgrade new technologies.	High cost of servers; regular maintenance required; dependency on the central server for most operations.	Windows Server, Linux Red Hat Enterprise Linux, Novell NetWare older.
