E - Commerce Business Models: A Friendly Comparison Table

What's the Deal?	B2B (Business-to-Business)	B2C (Business-to-Consumer)	C2C (Consumer-to-Consumer)
What It Is	Businesses selling to other businesses like a wholesaler supplying a retailer with goods.	Companies selling straight to you and me for personal use, like buying a phone online.	Regular people selling to each other, with a platform playing matchmaker.
Who's Involved	Businesses, big or small think manufacturers, wholesalers, or retailers.	Everyday shoppers looking for stuff they need or want.	Folks like us, buying and selling things (like that old couch or handmade jewelry).
Order Size	Big, bulk orders think pallets of products or huge service contracts.	Smaller purchases, like a single gadget or a streaming subscription.	All over the place—could be a used book or a rare collectible.
How Fast It Moves	Takes time lots of back-and-forth, negotiations, and contracts to seal the deal.	Super quick see it, like it, buy it, done!	Pretty fast, thanks to user-friendly platforms and trust in the system.
What Makes It Tick	- Tailored deals and pricing - Ties into business systems (like inventory tools) - Builds long-term partnerships	- Easy-to-use websites or apps - Personalized ads - All about a smooth shopping vibe	
Real-World Examples	- Alibaba: Connecting factories to businesses (alibaba.com) - Amazon Business: Bulk deals for offices (amazon.com/business)	- Amazon: Your go-to for everything (amazon.com) - Netflix: Binge-worthy shows at your fingertips (netflix.com)	- eBay: From vintage toys to rare coins (ebay.com) - Etsy: Handmade crafts and unique finds (etsy.com)
Tricky Bits	- Complex processes - Long waits for deals	- Tons of competition - Shoppers expect	- Quality can be hit-or-miss

Web Development Fundamentals Summary

1. What does responsive web design mean, and why is it important for websites today?

Because it gives user best experience and eye catching depending on what web design is develop

And without its internet are not relevant or appealing with the user

2. Give a real-life example of a website feature that likely uses JavaScript.

If else statement and switch, these codes are used to create a decision or function with the code

3. Which topic (HTML, CSS, JavaScript, or Responsive Design) did you find most interesting or challenging? Why?

For me all them are interesting because not only these things are hard to learn but it is also quit challenging because it gives me focus to do it even it seems, exhausting

A Quick Look at Web Architecture and Protocols

- **HTTP:** The basic way browsers and servers talk, sending requests (like GET or POST) and getting responses (like a web page or a 404 error). It uses port 80 and sends data in plain text.
- **HTTPS:** Like HTTP but secure, using TLS/SSL to encrypt everything so no one can snoop. It runs on port 443 and uses certificates to prove the server is legit.
- **DNS:** The internet's address book, turning domain names (like example.com) into IP addresses (like 192.0.2.1) so your browser can find the right server.
- **TCP/IP:** The backbone of internet communication. TCP makes sure data arrives correctly by breaking it into packets and double-checking delivery, while IP handles the addressing and routing.

When you type a URL, DNS finds the server's IP address, TCP/IP sets up a reliable connection, and HTTPS (or HTTP) handles the secure back-and-forth to load the page. It's like a well-coordinated team getting you to your website in a snap.
